Computing takes significant steps in the Nordics

The 1970s marked a significant period in computing, as the first microcomputers were introduced. Microcomputers allowed entirely new fields of technology development, such as system building, commercialising applications and developing maintenance services. Personal computers, however, remained unusual.

Some of the first computer networks were also established and tested during the 1970s. In 1971, Norway became the first non-English speaking nation to join the Internet.
